Year Questions with
Solutions**

TUTORIALS

Question 1

Clinical Question

A 20-year-old presented with a non-progressive hypopigmented skin lesion that has been present since birth. It shows white accentuation under Wood's lamp examination, and diascopy is inconclusive. What is the most likely diagnosis?

Options:

- A) Vitiligo
- B) Nevus depigmentosus
- C) Nevus anaemicus
- D) Indeterminate leprosy

Correct Answer: B) Nevus depigmentosus

Question 2

Non-Clinical Question

An image shows the characteristic skin findings of phrynoderma, described as plugged keratotic papules. Which of the following should be done next?

Options:

- A) Ocular examination
- B) Vitamin D3 status
- C) Deep tendon reflexes
- D) Vitamin B12 status

Correct Answer: A) Ocular examination

Question 3

Clinical Question

A patient presents with a plaque on the face with central clearing and atrophy, and his chest X-ray demonstrates apical calcification. Which of the following can be used for the diagnosis of the underlying condition?

Options:

- A) PCR
- B) Mantoux test
- C) Slit skin smear test
- D) Probe test

Correct Answer: A) PCR
